ABSTRACT

Long acting injectable formulations have been developed to sustain the action of drugs in the body over desired periods of time. These delivery platforms have been utilized for both systemic and local drug delivery applications. This review gives an overview of long acting injectable systems that are currently in clinical use. These products are categorized in three different groups: biodegradable polymeric systems, including microparticles and implants; micro and nanocrystal suspensions and oil-based formulations. Furthermore, the applications of these drug delivery platforms for the management of various chronic diseases are summarized. Finally, this review addresses industrial challenges regarding the development of long acting injectable formulations.

Contents

1. Introduction	20
2. Overview of strategies for development of long acting injectables	20
2.1. Microencapsulation	20
2.2. Preformed and in situ forming implants	22
2.3. Molecular and particulate drug modification	22
2.3.1. Molecular drug modification (prodrugs)	22
2.3.2. Particulate drug modification (micro/nano drug crystals)	24
3. Clinically established long acting parenteral formulations	25
3.1. Long acting biodegradable polymeric systems for parenteral use	25
3.1.1. PLGA-based long acting biodegradable systems	25
3.1.2. Marketed non-PLGA long acting parenteral formulations	30
3.2. Marketed oil-based long acting parenteral formulations	32
3.2.1. Androcur Depot®	32
